QRelix

TEAM GUIDE

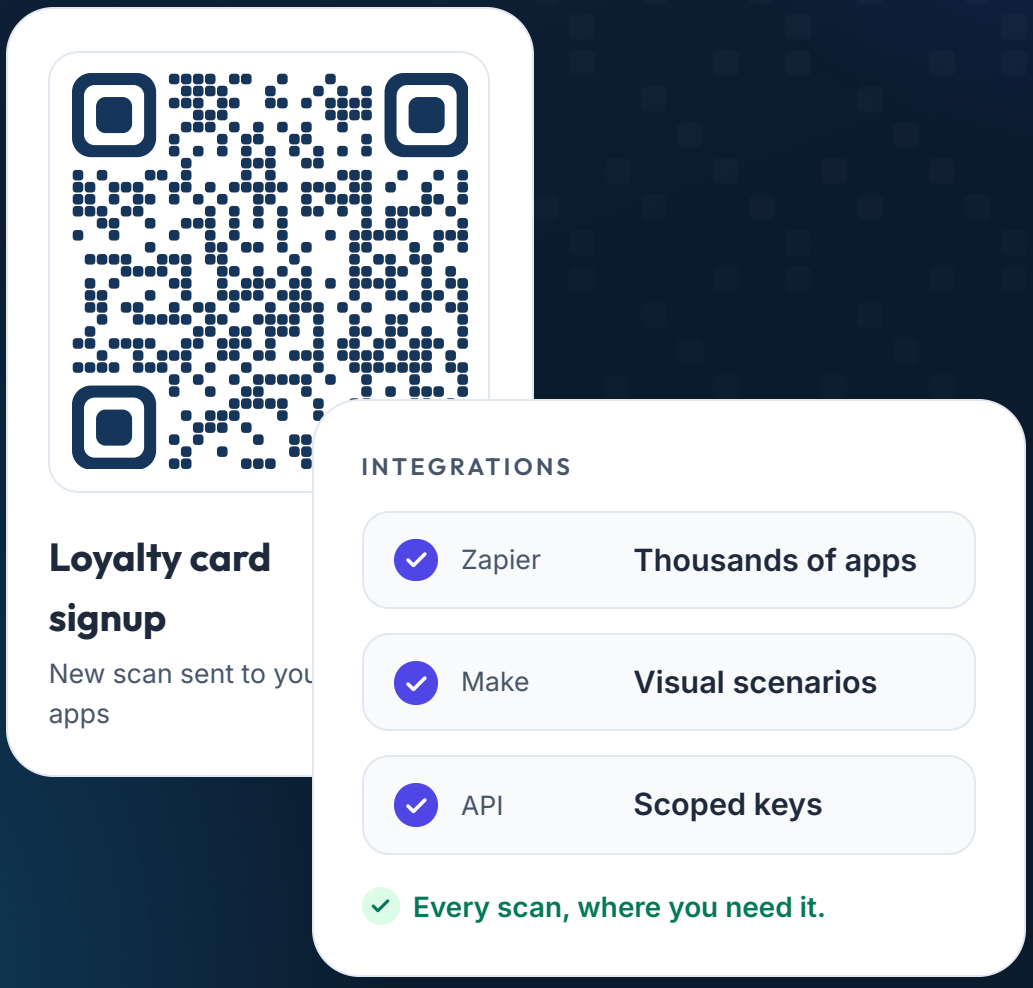

Connect QRelix to your tools

Send scans to your apps with Zapier, Make, webhooks, or the API.

1 minute
to finish

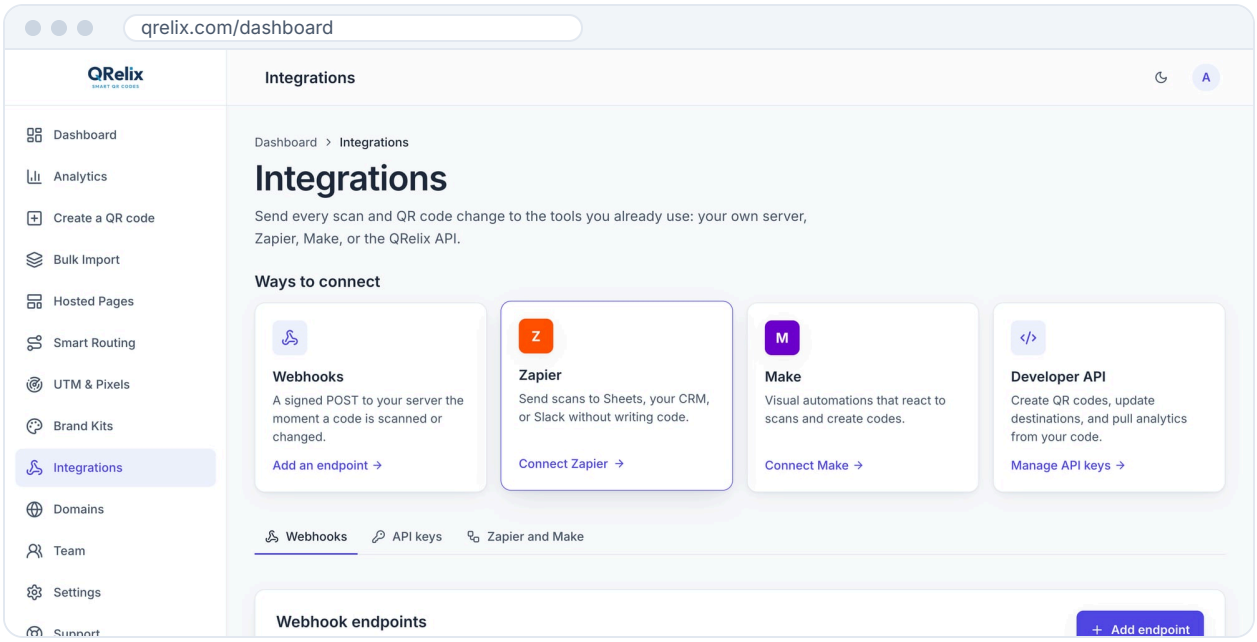

Team plan
API, Zapier, and Make

4 steps
with screenshots

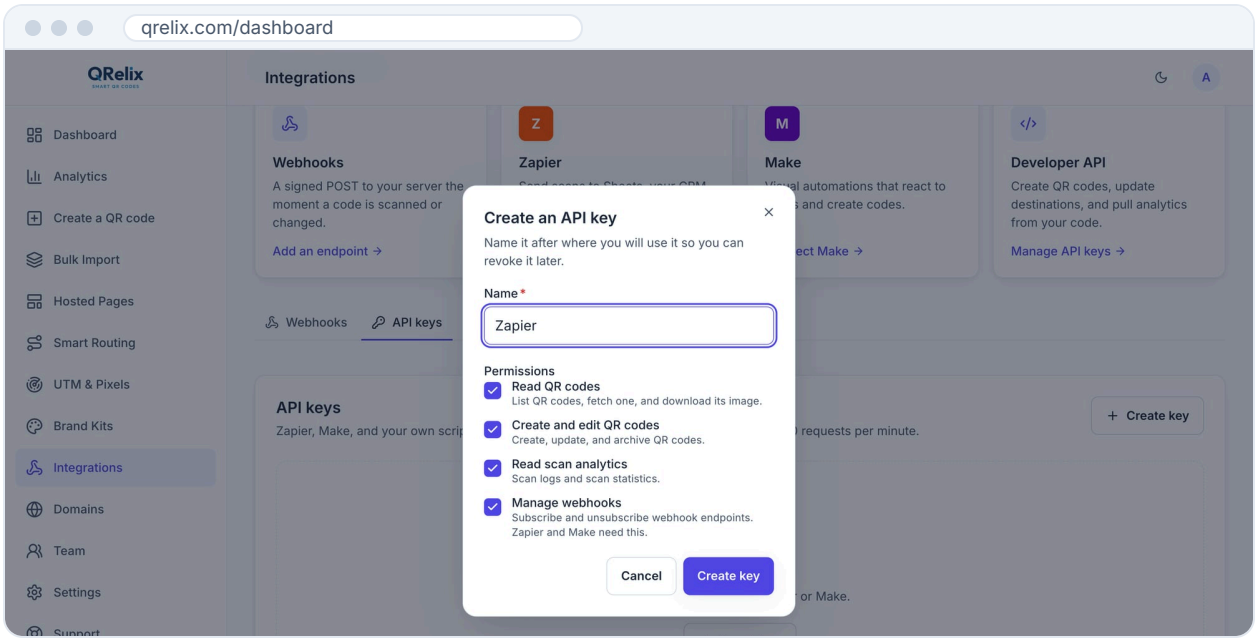

1 Open Integrations

Open Integrations in the sidebar. Choose webhooks for your own server, Zapier or Make with no code, or the developer API to create codes, update destinations, and pull analytics.

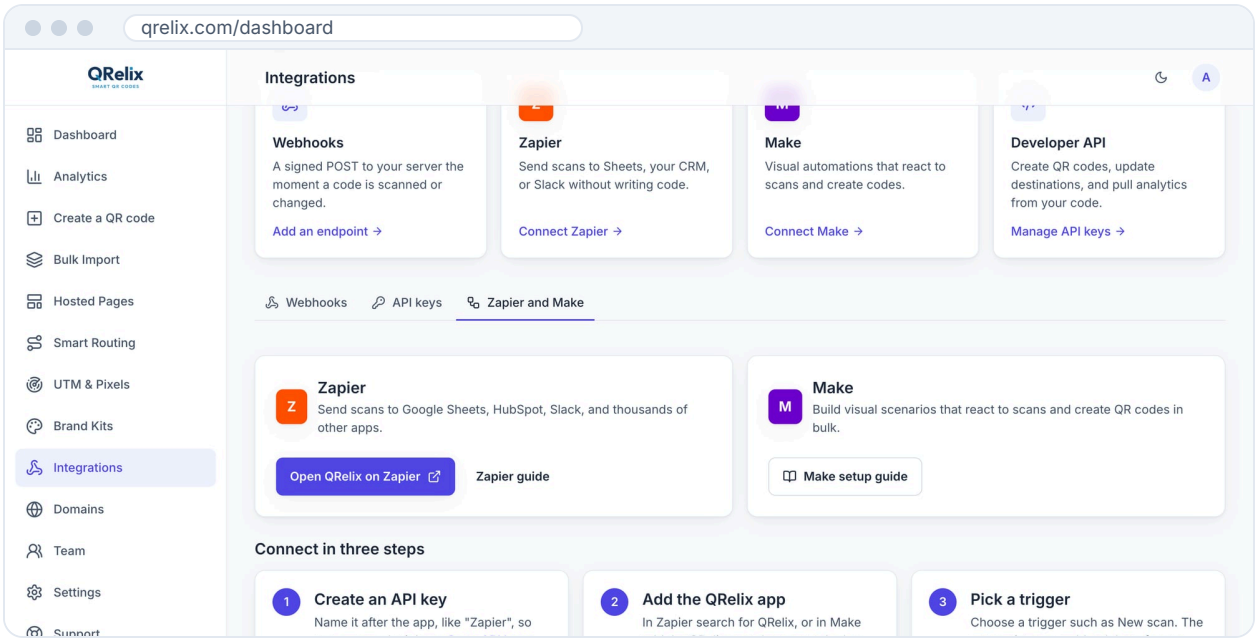

2 Create an API key

On the API keys tab, select Create key. Name it after where you will use it, then choose its permissions. Zapier and Make need Manage webhooks. Copy the key when it appears: it is only shown once.

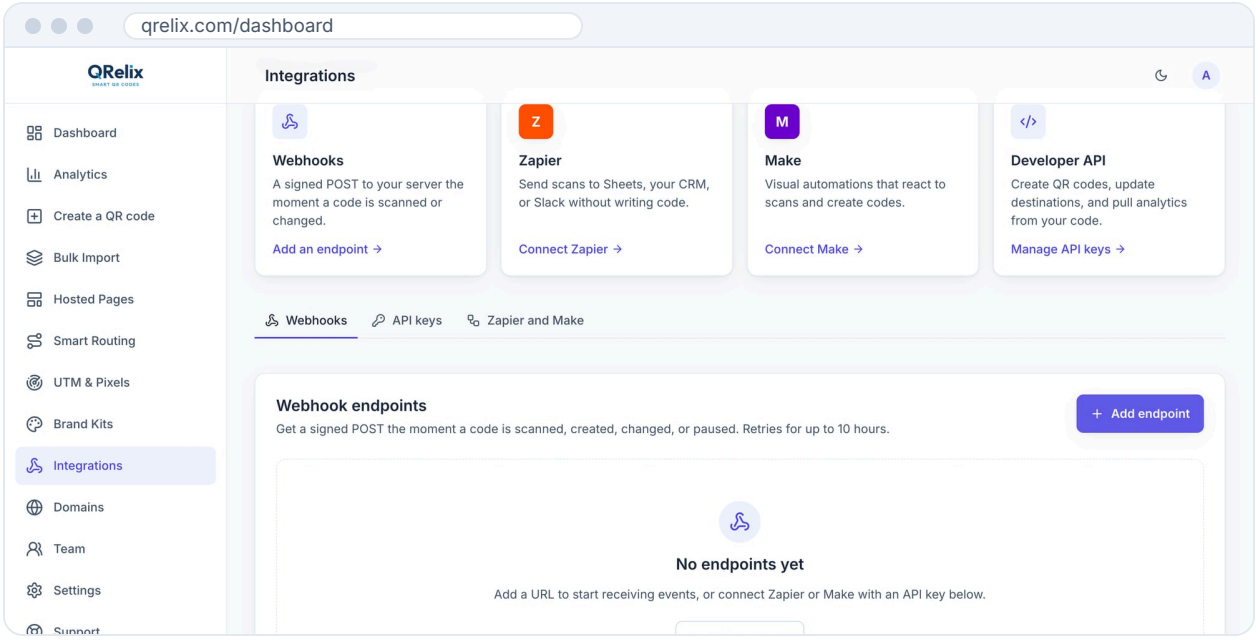

3 Connect Zapier or Make

In Zapier search for QRelix, or in Make add the QRelix app, and paste your key. Choose a trigger such as New scan. The app registers a webhook for you, listed under Webhooks with its source.

4 Or use webhooks and the API

On the Webhooks tab, add an endpoint to get a signed POST the moment a code is scanned, created, changed, or paused, with retries for up to 10 hours. The API docs cover creating codes, updating destinations, and pulling analytics.

Good to know

One key per app

Make a separate key for each connection, so you can revoke one without touching the others.

Least permission

Turn off permissions a key doesn't need. A reporting script only needs Read scan analytics.

Rate limit

Each key can make 120 requests per minute.

On the Team plan

The developer API, Zapier, and Make are part of QRelix Team.

Create your first smart QR code.

Free plan, no credit card. Edit the link after printing and see every scan.
