QRelix

TEAM GUIDE

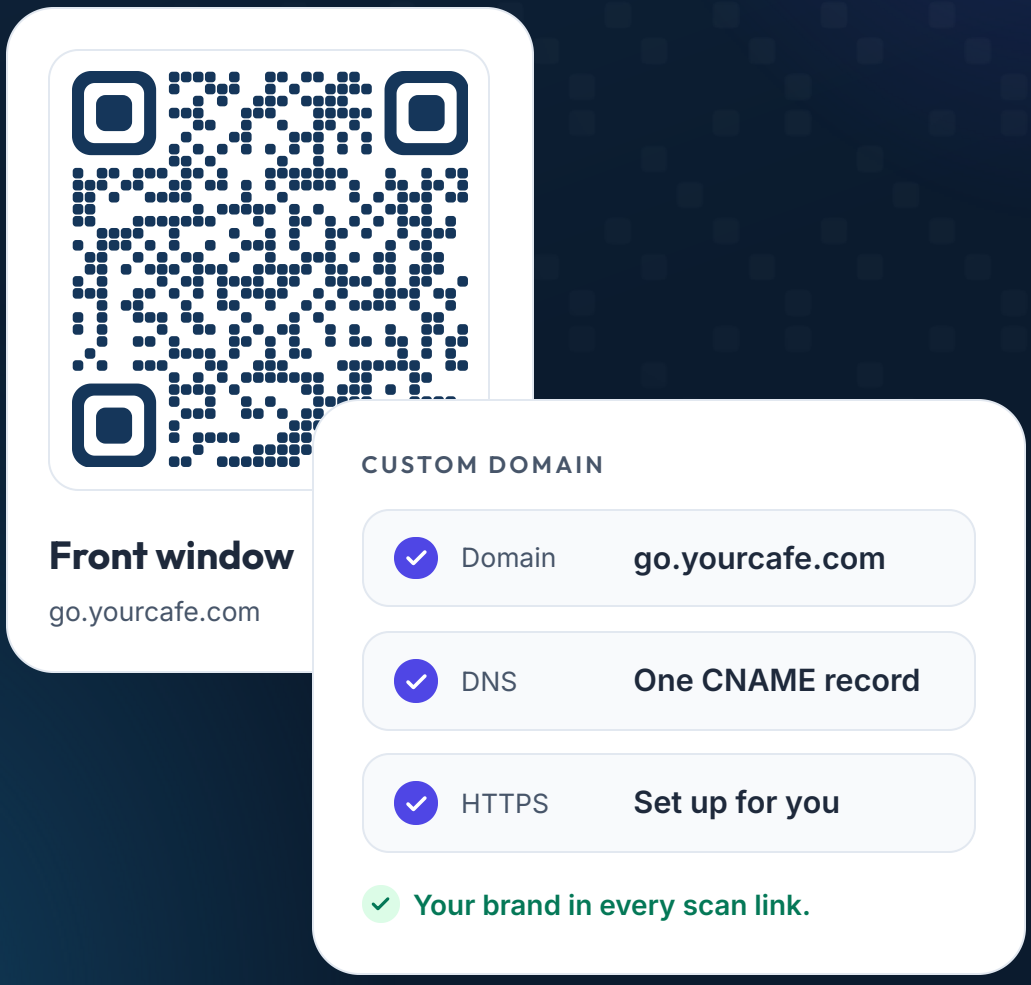

Use your own domain for QR codes

Scan links on go.yourbrand.com, instead of qrelix.com.

1 minute
to finish

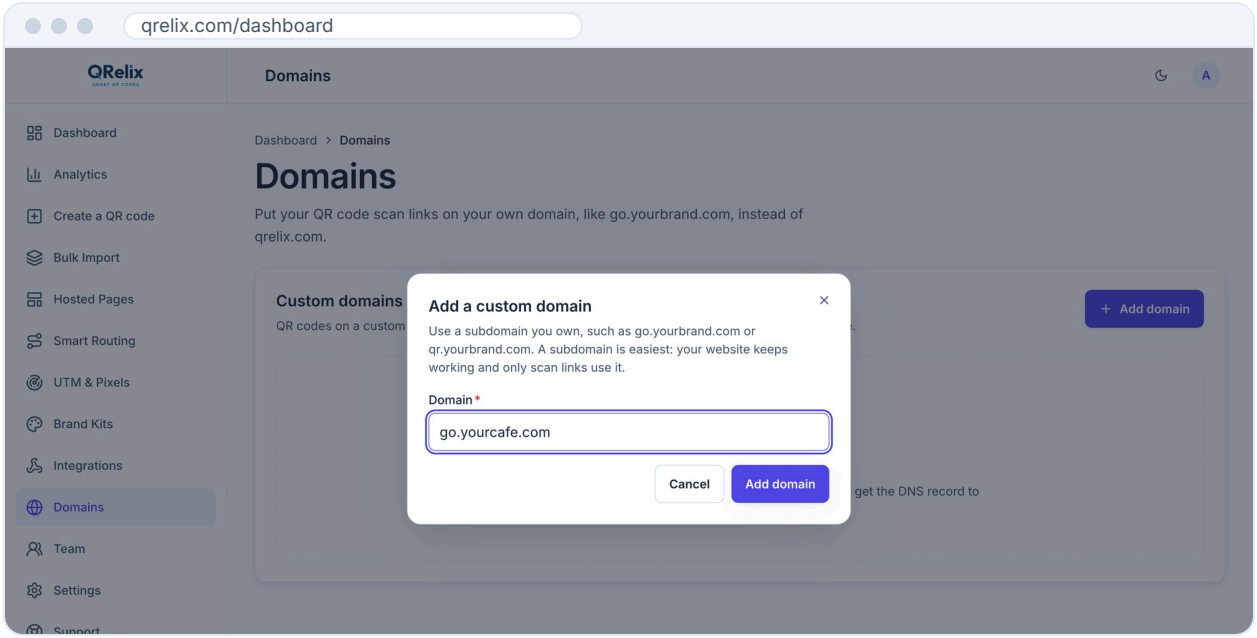

Team plan
Up to 3 domains

3 steps
with screenshots

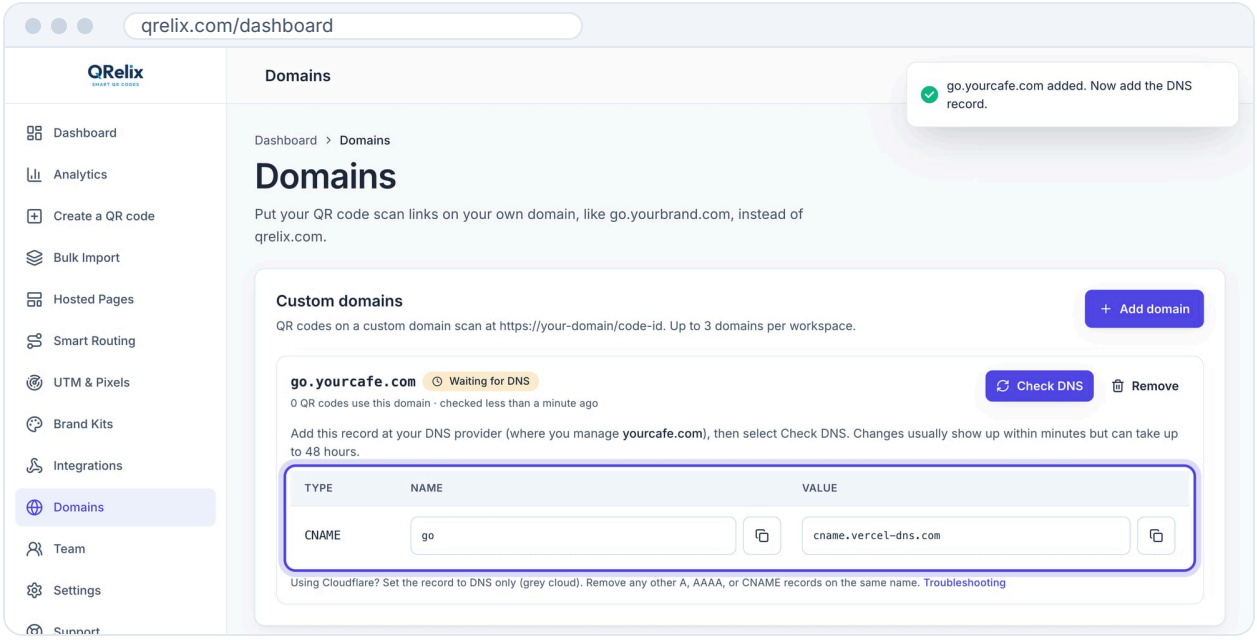

1 Add your domain

Open Domains in the sidebar and select Add domain. Enter a subdomain you own, such as go.yourbrand.com. Your website keeps working, and only scan links use it. A workspace can have up to 3 domains.

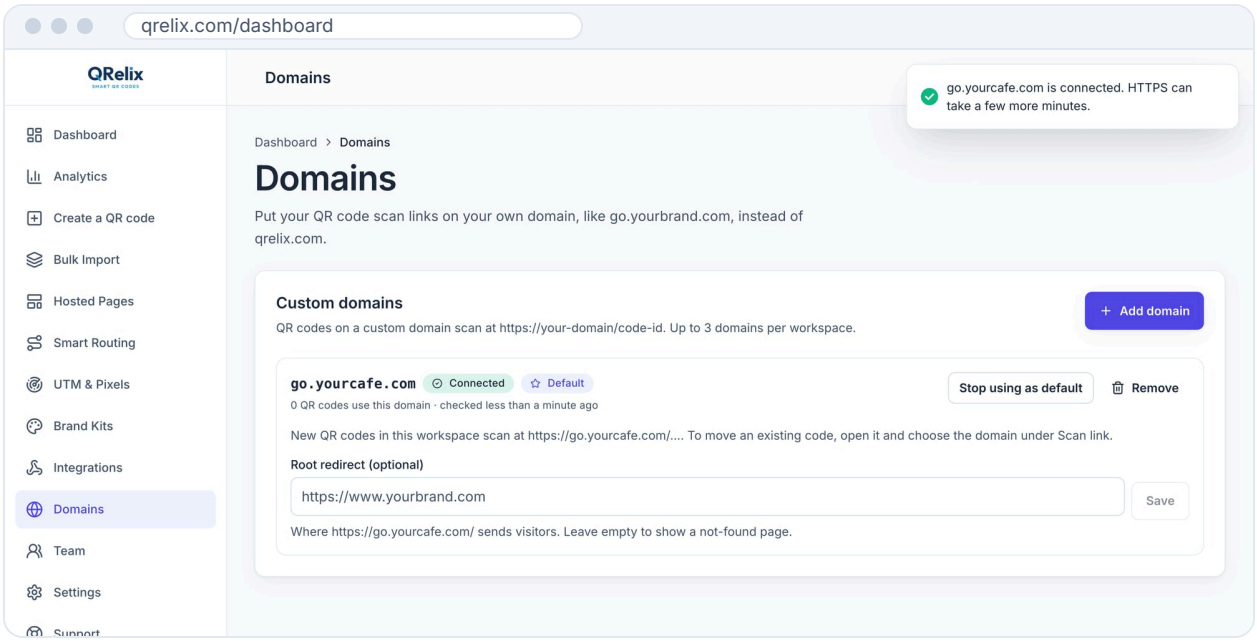

2 Add the DNS record

QRelix shows one CNAME record. Add it where you manage your domain, and remove any other A, AAAA, or CNAME records on the same name. HTTPS is set up for you.

3 Use it on your codes

Once connected, your workspace default domain is used for new codes automatically, and you can change or stop using the default at any time. To move an existing code, use the Scan link card on its Edit page. Copies you already printed keep the old link, so download the new image and reprint them.

Good to know

Pick something short

A short name such as go, qr, or scan works well on printed material.

Keep the record in place

Printed codes depend on your DNS record. Keep it for as long as those codes are in use.

Using Cloudflare?

Set the record to DNS only (grey cloud).

On the Team plan

Team includes up to 3 custom domains per workspace.

Create your first smart QR code.

Free plan, no credit card. Edit the link after printing and see every scan.
