HOW-TO GUIDE

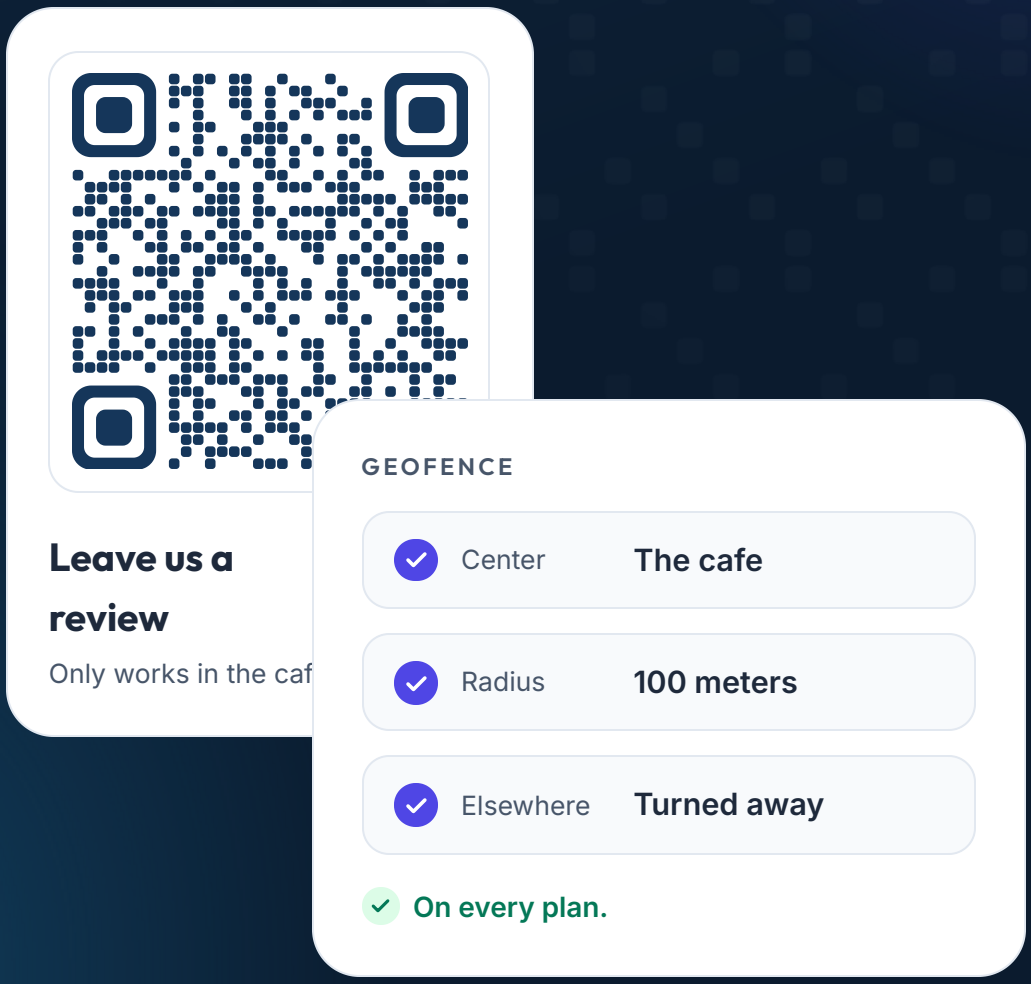

Lock a QR code to a place

A geofenced code only works for people who are actually there.

WHY IT MATTERS

Only for people who are really there.

- **Reviews** From real visitors, not a shared photo
- **Offers** Redeemed in the store
- **Staff codes** Only work on site

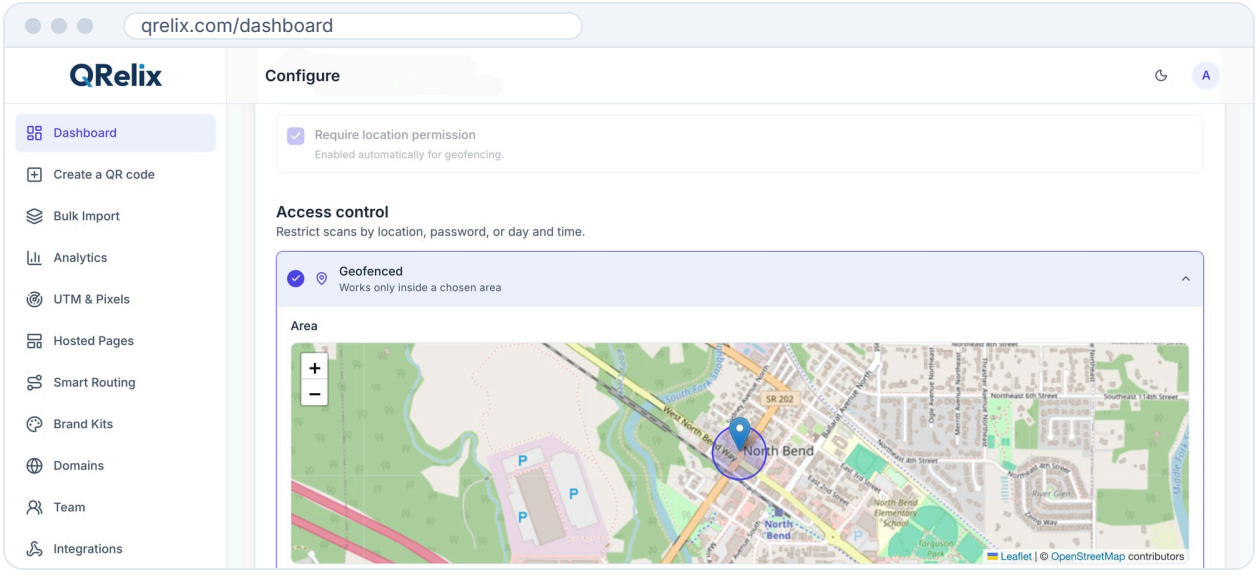

1 Turn on Geofenced

Open a QR code, select Edit, then More settings. Under Security and access, choose Geofenced.

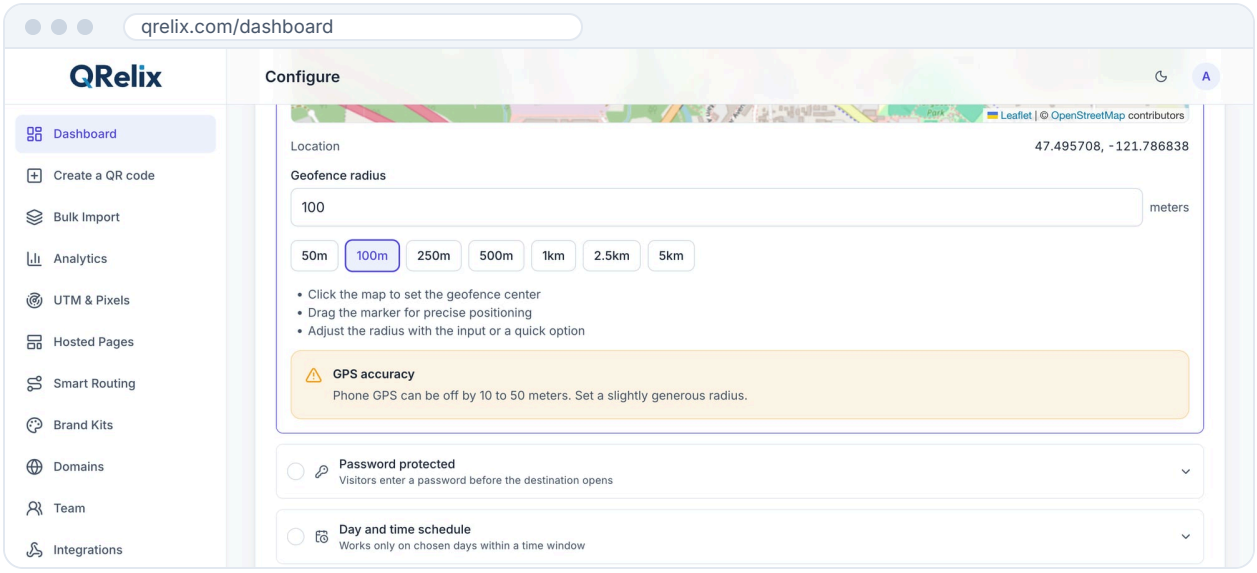

2 Set the center

Click the map to place the center of the area, then drag the marker for precise positioning. Zoom in to find your building.

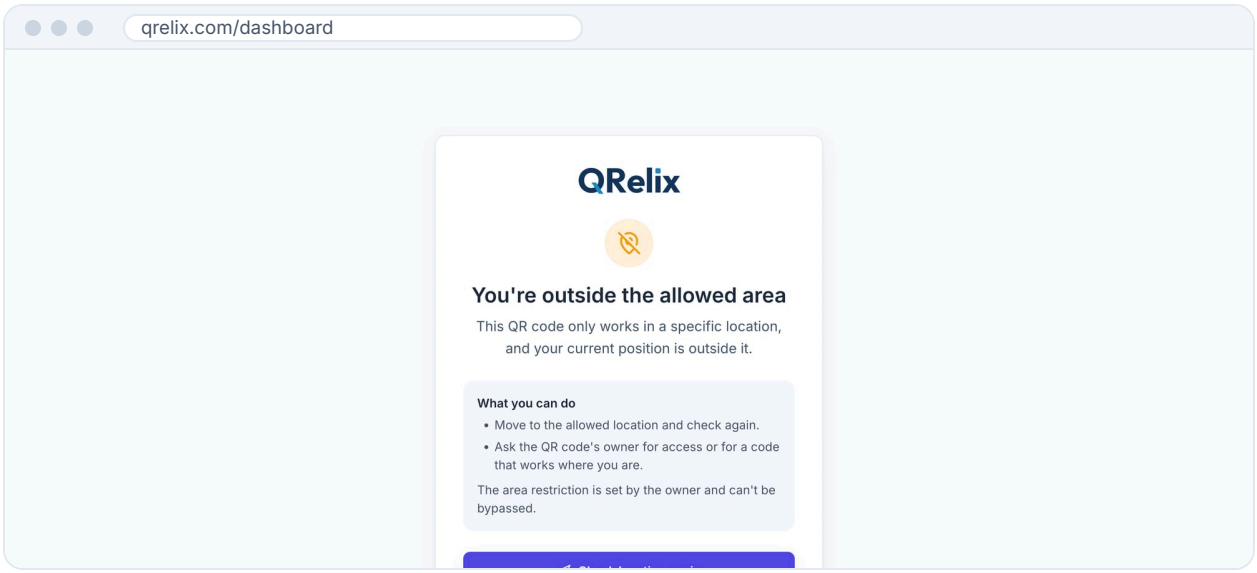

3 Pick the radius

Type a radius or choose a quick option from 50 meters to 5 kilometers. Phone GPS can be off by 10 to 50 meters, so set a slightly generous radius.

4 What everyone else sees

People scanning outside the area see that they are outside the allowed area, and your page does not open. Change the area or remove the geofence at any time; the printed code stays the same.

Good to know

Location permission

Scanners are asked to share their location. Tell them why on the sign, such as for in-store guests.

One rule at a time

A code can use one access rule at a time: a geofence, a password, or a schedule.

Big enough to work

Indoors, GPS drifts. A radius of 100 to 250 meters suits most shops and venues.

Every plan

Geofencing is part of the security suite on Free, Pro, and Team.

Create your first smart QR code.

Free plan, no credit card. Edit the link after printing and see every scan.
